Shustov A.V., Gavrilova I.V., Netesov S.V.;
"Genetic variability of hepatitis C virus in Western Siberia.";
Submitted (APR-2002) to the EMBL/GenBank/DDBJ databases.
-1- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MANA (BY SIMILARITY).
    Viruses; ssRNA positive-strand viruses, no DNA stage; Flaviviridae;

"Genetic variability of hepatitis C virus in Western Siberia.";
"Genetic variability of hepatitis C virus in Western Siberia.";
Submitteed (Apr. 202) to the EMBL/GenBank/DDBses.
-1-SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GIYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA (BY SIMILARITY).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 25, Application US/08921887

Patent No. 603071

GENERAL INFORMATION

APPLICANT: KHUDYAKOV, YURI E.

APPLICANT: FIELDS, HOWARD A.

TITLE OF INVENTION: MOSAIC PROTEIN AND RESTRICTION

TITLE OF INVENTION: ENDONUCLEASE ASSISTED LIGATION METHOD FOR MAKING THE SAME NUMBER OF SEQUENCES: 55

CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Length 28;

             Sequence 77, Application US/09921397
Patent No. US20020151484A1
GENERAL INFORMATION
GENERAL INFORMATION:
TITLE OF INVENTION: SID nucleic acids and polypeptides selected from
TITLE OF INVENTION: pathogenic strain of the hepatitis C virus and
TITLE OF INVENTION: applications thereof
FILE REFERENCE: B4809A JA2
CURRENT APPLICATION NUMBER: US/09/921,397
CURRENT FILING DATE: 2001-08-02
PRIOR FILING DATE: 2000-08-03
PRIOR FILING DATE: 2000-08-03

(HCV) genomic RNA. The protein can be easily detected by antibodies in an assay for the detection of HCV. The DNA and the protein are useful for classifying the subtype of HCV. At least a part of the protein may be used as a vaccine against HCV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cDNA was prepared from HCV genomic RNA. Full-length clone JK1-B 9405 nuclectides long) and 14 shorter clones were isolated by PCR amplification, including clone JK3-A. Primer/probes derived from th sequences of these clones can be used in diagnostic assays for HCV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                                                                                                   ò
                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                             The invention relates to a mosaic protein, comprising a plurality of homologous antigenic peptides from different genotypes of a species. The antigenic peptides are from nucleocapsid (NC) proteins. A method for synthesising an artificial gene that encodes the mosaic protein is also provided. The method is designated restriction endonuclease assisted ligation (REAL). The mosaic protein and the artificial an mosaic protein are useful for detecting a hepatitis infection in an individual. The mosaic gene and protein is also useful for vaccination against infection, especially hepatitis. The artificial gene and the resulting mosaic protein improve the sensitivity, specirum of immunoreactivity, and antigen specificity of enzyme spectrum of immunosasays. This provides improved detection of hepatitis C virus. Sequences AAV06673-681 represent amino acid sequence of each monomer comprising the NC mosaic protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is a polypeptide comprising a 3023 amino acid sequence which is encoded by a cDNA (AAT13279) to a hepatitis C virus

CDNA was prepared from HCV genomic RNA. Full-length clone JK1-B (9405 nucleotides long) and 14 shorter clones were isolated by PCR amplification, including clone JK3-C. Primer/probes derived from the sequences of these clones can be used in diagnostic assays for HCV. See AAQ40425-Q40439.

                                                                                                                                                                                                                                                            cDNA was prepared from HCV genomic RNA. Full-length clone JK1-B (9405 nucleotides long) and 14 shorter clones were isolated by PCR amplification, including clone JK3-B. Primer/probes derived from the sequences of these clones can be used in diagnostic assays for HCV.

```
The invention relates to a mosaic protein, comprising a plurality of homologous antigenic peptides from different genotypes of a species. The nortigenic peptides are from nucleocapsid (NC) proteins. A method for synthesising an artificial gene that encodes the mosaic protein is also provided. The method is designated restriction endonuclease assisted ligation. The method for protein and the artificial mosaic protein and the artificial mosaic protein are useful for detecting a hepatitis infection in an individual. The mosaic gene and protein is also useful for vaccination against mosaic gene and protein is also useful for vaccination against artificial gene and protein is also useful for vaccination against artificial gene and the resulting mosaic protein improve the sensitivity, specially hepatitis C. The method of synthesizing the artificial gene and the resulting mosaic protein improve the sensitivity, specially mosaic protein and artigen specificity of enzyme communoassays. This provides improved detection of hepatitis C virus.
                                                                                                                             Mosaic protein; antigenic peptide; nucleocapsid; NC; hepatitis; REAL; restriction endonuclease assisted ligation; vaccination.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             antigenic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel attenuated flavivirus live vaccine comprising a flavivirus mutant that has a deletion of at least 4 consecutive amino acids from the capsid protein, provided that the consecutive amino acids from the capsid protein, provided that the vaccine of the invention has virucide, antinflammatory and hepatotropic vaccine of the invention has virucide, antinflammatory and hepatotropic activity. The attenuated vaccine, and similar nucleic acid vaccines that encode the mutated capsid protein, are useful for protection against a encephalitis, dengue, classical swine fever, bovine viral diarrhoea and hepatitis C. The specified deletion: (i) produces a reliably attenuated virus that does not revert to virulence; (ii) is exactly defined and does of effect immune responses to important proteins; and (iii) can not generate a non-natural virus by recombination. The mutant viruses eliminate the need to produce large amounts of infectious/virulent viruses, and can be produced with less expense. The protective response to flavivirus lasts significantly longer than that to killed vaccines. This sequence represents a fragment of the capsid protein from Hepatitis curver.

Isolated cDNA sequences are used for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunishing against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, saliva, Lymphocytes or other mononuclear cells. The antibodies may be used in the prevention of HCV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   HCV; El; envelope 1; core protein; HCV genotyping; antibody; vaccine;

the specification, but codon usage shows that the
only possible amino acid at this pos. is Gly"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Hepatitis C virus; subtype; polymerase chain reaction; amplification; PCR; primer; probe; antibody; infection.
                                                                 AAR92936-R92987 are HCV core proteins derived from 52 different HCV isolated cDNA sequences are used for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, saliva, lymphocytes or other monounchear cells. The antibodies may be used in the prevention of HCV infection.
      to determine HCV genotype and as vaccines against HCV infection
                                                                                                                                                                                                                                                                                      ö

                                                                                                                                                                                                                                                                                                                               AAR92936-R92987 are HCV core proteins derived from 52 different HCV isolates. Isolated cDNA sequences are used for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, be used in the prevention of HCV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The invention relates to a mosaic protein, comprising a plurality of homologous antigenic peptides from different genotypes of a species. The antigenic peptides are from nucleocapsid (NC) proteins. A method for synthesising an artificial gene that encodes the mosaic protein is also provided. The method is designated restriction endonuclease assisted ligation (REAL). The mosaic protein and the artificial mosaic protein are useful for detecting a hepatitis infection in an individual. The mosaic gene and protein a lasto useful for vaccination against infection, especially hepatitis C. The method of synthesizing the artificial gene and the resulting mosaic protein improve the sensitivity, spectrum of immunoreactivity, and antigen specificity of enzyme immunoassays. This provides improved detection of hepatitis C virus. Sequences AAV06673-681 sepresent amino acid sequence of each monomer comprising the NC mosaic protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Hepatitis C virus; subtype; polymerase chain reaction; amplification; PCR; primer; probe; antibody; infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Hepatitis C virus poly:nucleic acid unique to unidentified sub:type - used to develop probes and primers for new sub:types and vaccines to prevent and treat infection
                                                                                                                                                   New mosaic protein, comprising a plurality of homologous antigenic peptides from different genotypes of a species - useful for detecting hepatitis infection in an individual
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            hepatitis C virus subtypes 1 c. 2a-d, 3a-f, 4a-j, 5a and 6a. They esp. from the novel subtypes 1a-c, 2a-d, 3a-f, 3g, 4k-m, 7a-c or types 9, 10 or 11. The sequences corresp. to the 5' genome. This sequence represents amino acids 1-317 from the HCV types 7c and 8a isolates VN4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The new HCV types were isolated from patients with chronic HCV from the benelux countries. France, Cameroon and Vietnam, because of their aberiant reactivities. The RNA was extracted, cDNA synthesised and PCR amplified, cloned and genotyped. The YUR, Core/El and NSSB regions were sequenced either directly or partially and used to classify the new viruses into (sub)types based on comparison with known sequences. The sequences were used to generate the peptides AAR96424-R96524. The aequences can also be used to synthesise probes and primers for the detection of HCV in a sample. The polypeptides can be used codetect anti-HCV antibodies, for HCV typing or to prevent HCV infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequences AAR96526-R96578 represent novel sequences isolated from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Mosaic protein; antigenic peptide; nucleocapsid; NC; hepatitis; REAL;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                     Benelux countries, France, Cameron and Vietnam, because of their aberrant reactivities. The RNA was extracted, cDNA synthesised and PCR amplified, cloned and genotyped. The 5 UK. Core-fin and NSSB regions were sequenced either directly or partially and used to classify the new viruses into (sub)types based on comparison with known sequences. The sequences were used to generate the peptides ARA96424-R96524. The sequences can also be used to synthesise probes and primars for the detection of HCV in a sample. The polypeptides can be used to detect anti-HCV antibodles, for HCV typing or to prevent HCV infections.
                                            The sequences AAR96526-R96578 represent novel sequences isolated from hepatitis C virus subtypes different from subtypes la-c, 2a-d, 3a-f, 4a-j, 5a and 6a. They esp. from the novel subtypes ld-f, 2e-i, 2k, 2l, 3g, 4k-m, 7a-c or types 9, 10 or 11. The sequences corresp. to the 5' untranslated region (UR), the Core/El, NS4 or NS5B regions of the genome. This sequence represents amino acids 1-74 from the HCV type lla isolate FR19.
                                                                                                                                                                                         The new HCV types were isolated from patients with chronic HCV from the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAR92936-R92987 are HCV core proteins derived from 52 different HCV isolates. Isolated cDNA sequences are used for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunising against HCV infection. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    envelope 1; core protein; MCV genotyping; antibody; vaccine,

AAR92936-R92987 are HCV core proteins derived from 52 different HCV isolates. Isolated cDNA sequences are used for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, sallva, lymphocytes or other mononuclear cells. The antibodies may be used in the prevention of HCV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

genome polyprotein N2 - hepatitis C virus
N;Contains: envelope protein E1; nonstructural protein E2/NS1
N;Contains: envelope protein E1; nonstructural protein E2/NS1
C;Species: hepatitis C virus
C;Species: 14-Jul-1994 #sequence_revision 14-Jul-1994 #text_change 17-Nov-2000
C;Accession: PC2061

Genomic characterization and mutation rate of hepatitis C virus
isolated from a patient who contracted hepatitis during an epidemic
of non-A, non-B hepatitis in Japan.";
J. Gen. Virol. 73:2725-2739(1992).
-1- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MRRA.

Genome polyprotein (Contains: Capation update)
Genome polyprotein (Contains: Capation protein C (Core protein); Matrix
protein (Envelope protein M); Major envelope protein E; Nonstructural
proteins NSI and NS2] (Fragment): (HCV).
Hepatitis C virus (isolate HC-J7) (HCV).
Viruses; SSRNA positive-strand viruses, no DNA stage; Flaviviridae;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
-1. FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
-1. FUNCTION: THE SMALL PROTEING A POSSIBLE MEMBRANE-RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
-1. SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
LIPOPHOPIENI ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MEDLINE-92230222; PubMed-1314459; Okamamoto K., Lizuka H., Okamoto H., Kurai K., Okada S.I., Yamamoto K., Lizuka H., Tanaka T., Fukuda S., Tsuda F., Mishiro S.; Tril-length sequence of a hepatitis C virus genome having poor homology to reported isolates: comparative study of four distinct qenotypes.";

"Hepatitis C virus NS3 RNA helicase domain with a bound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (RNA)(N).

-1- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1 AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
-1- PTM: THE STRUCTURAL PROTEINS C, E1 AND E2 ARE PRODUCED BY PROTEOLYTIC PROCESSING BY THE HOST SIGNAL PEPTIDASES.
-1- SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY 199.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    FUNCTION: NSSA SEEMS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE FUNCTION: NSSB IS A RNA-DEPENDENT RNA POLYMERASE THAT PLAYS AN ESSENTIAL ROLE IN THE VIRUS REPLICATION.

Mucleotide sequence of the genomic RNA of hepatitis C virus isolated
from a human carrier: comparison with reported isolates for conserved
from a human carrier: comparison with reported isolates for conserved
and divergent regions.
T. J. Gen. Virol. 72.2697-2704(1991).
J. Gen. Virol. 72.2697-2704(1991).
C -1- FUNCTION: THE SMALL PROFIEIDS NS2A, NS2B, NS4A AND NS4B ARE
HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
C -1- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6
position, Cys or Thr in Pl and Ser or Ala in Pl'
C -1- CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate +
            (RNA)(N).
SUBUNT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       IPR002868; HCV_NSSa.

The Taiwanese hepatitis of viral genome: sequence determination and mapping the 5' termini of viral genomic and antigenomic RNA.";

Virology 188:102-13(1992).

INCATION: THE SMALL PROYEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

I. CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in Pl and Ser or Ala in Pl'.

I. CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate +
          RNA-DIRECTED RNA POLYMERASE (POTENTIAL).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SUBDIVIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:

                                                                                                                                                                                                                                                                                                                                                                                                                                  hepatitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Chayama K.;
Submitted (FEB-1955) to the EMBL/GenBank/DDBJ databases.
Submitted (FEB-1955) to the EMBL/GenBank/DDBJ databases.
-!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA (BY SIMILARITY).
EMBL: D49374; BAAD0 MRNA (BY SIMILARITY).
HSSP; P27958; 1A1V.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 01-NOV-1996 (TrEMBLrel. 01, Created)
01-NOV-1996 (TrEMBLrel. 01, Last sequence update)
01-MAR-2003 (TrEMBLrel. 23, Last annotation update)
Genome polyprotein.
Hepatitis C virus type 3b.
Hepatitis C virus type 3b.

Hepatitis C virus.
Viruses; ssRNA positive-strand viruses, no DNA stage; Flaviviridae;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Arch. Virol. 141:1101-1113(1996).
-1- SUBGNIT: THE VIRION OF THIS VIRUS IS A NUCLECCAPSID COVERED BY
-1- LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLECCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ohno T., Mizokami M.;
